

DAVID AI — Master Prompt for Lovable

Purpose

This document is the master specification for building David AI as a production-ready personal AI operating system. It combines the previously discussed architecture, futuristic interface, autonomous engineering behavior, AI orchestration, backend integration, memory, voice, security, projects, tasks, devices, website generation, video generation, deployment, and owner controls.

Frontend

Create a premium futuristic interface with a dark theme accented by deep reds, glowing AI sphere, HUD panels, responsive layouts, animations reacting to AI states, automatic voice listening, interrupt-on-user-speech, multilingual English/Yoruba support, and polished dashboards.

Backend

Integrate automatically with both backend variants provided by the user. Detect the richer backend configuration (including API/provider configuration) when available while remaining compatible with the lighter backend. Preserve functionality and never expose secrets in frontend code.

Capabilities

Support AI chat, long-term memory, tasks, projects, tools, website generation from prompts, deployment through the backend pipeline, AI-assisted video generation (up to 2 hours where provider capabilities allow), image generation, document generation, code generation, provider routing, streaming, and extensible tool architecture.

Owner

Recognize the configured owner profile with owner ID SEBIOMO231, display title 'My Lord', email sebiomo231@gmail.com, fingerprint plus password authentication, elevated administrative permissions, approval workflow for new user registrations, and placeholder OWNER_PASSWORD=.

Engineering

Do not stop to ask routine implementation questions. Inspect, build, test, debug, repair, verify, and continue automatically. Fix TypeScript, API, authentication, routing, Prisma, build, lint, and deployment issues before completion.
